REDCap

BCCC Support Presentation

Alejandro M. Mantero, M.S., Ph.D. (candidate)
Introduction to REDCap

- REDCap is a software suite developed for the purpose of designing, maintaining, and populating research databases through the web.
- It features various functions ranging from user access controls to ensure data security and integrity, an easy to use report builder, and the ability to export data directly into formats readable by most statistical software suites.
- REDCap also allows for the design and electronic distribution of surveys.
- Usage of REDCap ensures that the data will be organized for when it is time to conduct statistical analysis.
- REDCap can be accessed at http://redcap.med.miami.edu
REDCap support provided under the Miami CTSI

- As part of the Miami CTSI, the Biostatistics Collaboration and Consulting Core offers support for your REDCap implementation.
- This includes:
  - Going over your project and helping you to design a database that will ensure all important data has a field and is uniformly coded
  - Setting up field validation and required fields to ensure all important items are filled out when populating
  - Setting up reports to determine state of data population
  - Programming branching logic to ensure that only fields relevant to an instance are displayed and filled out
  - Teaching you how to use other features such as the data exportation tool
Thank you for your time.

The BCCC offers personalized support for REDCap through the Miami CTSI.
